2. What is a sonnet? \_\_\_\_\_ (1)

Why did Shakespeare choose to write in the form of a sonnet? (2)

\_\_\_\_\_

3. What happened to Shakespeare's son Hamnet? \_\_\_\_\_ (1)

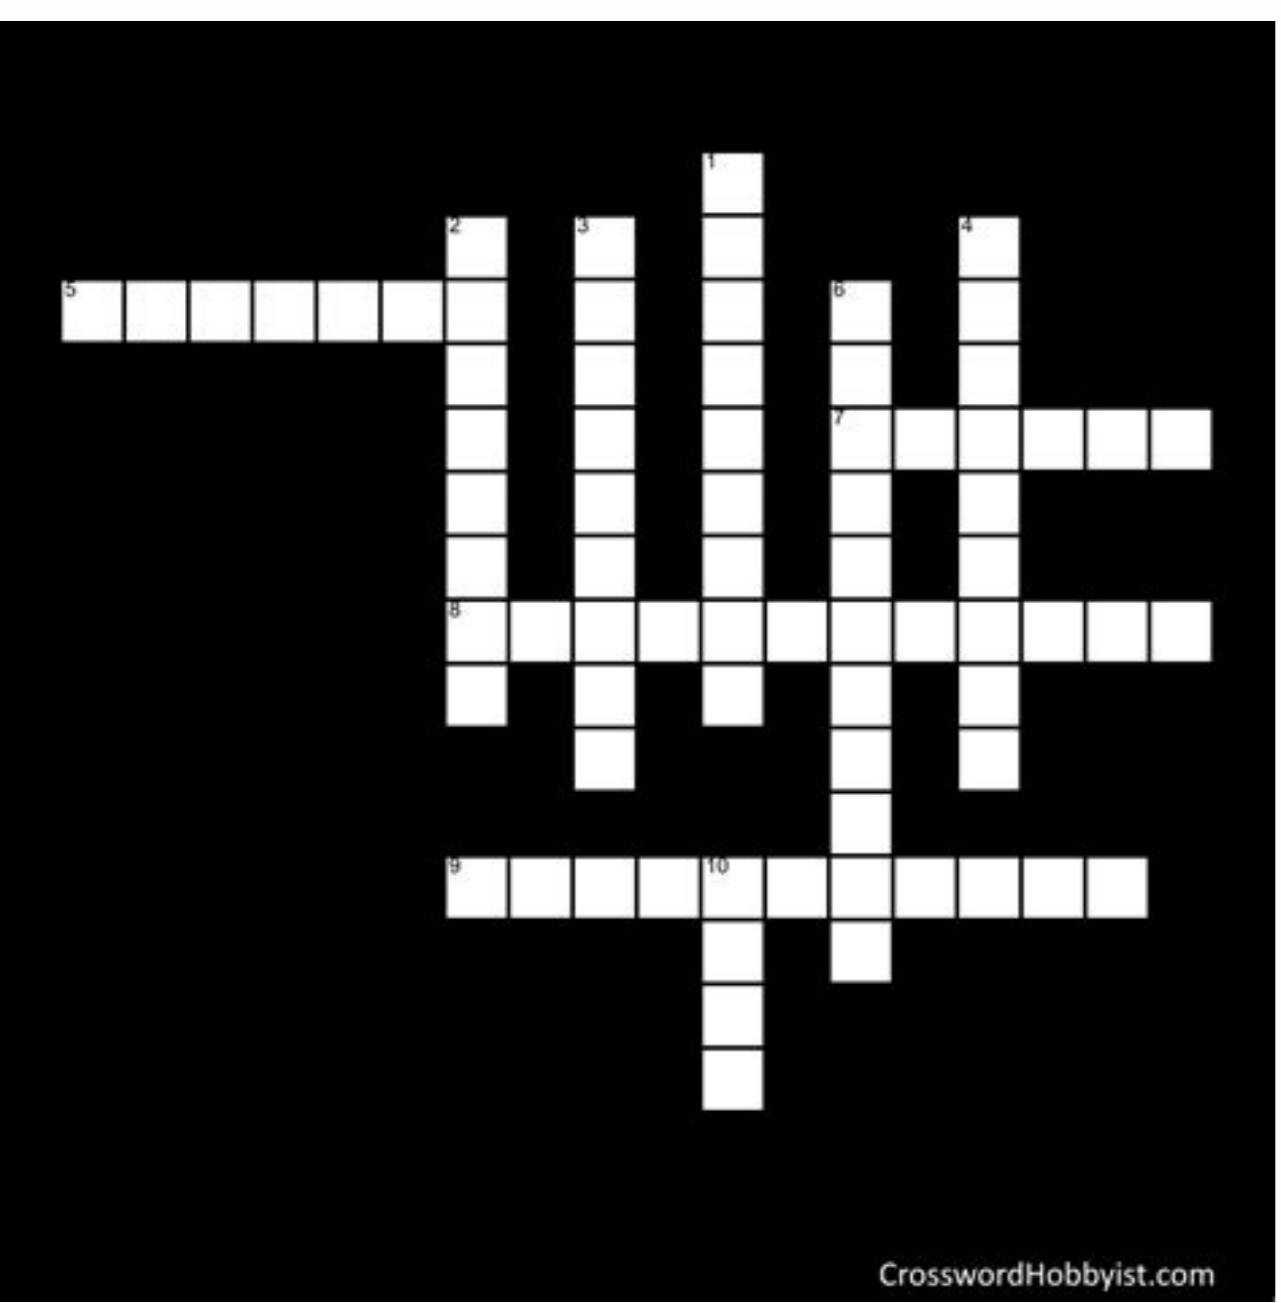

4. Why was language so important to his plays? \_\_\_\_\_ (1)

5. Which political or social events influenced Shakespeare's choice of subjects for his plays? (2)

6. Why was Shakespeare's Globe Theatre forced to close? (2)

7. Why did the politicians of England dislike the theatre? (2)

\_\_\_\_\_

<https://www.khan.ac.uk/learn/behavior/natural-selection.html>

18. Natural selection is a \_\_\_\_\_ of evolution. Organisms that are more \_\_\_\_\_ to their environment are more likely to \_\_\_\_\_ and pass on the genes that aided their success. This process creates species that \_\_\_\_\_ and \_\_\_\_\_ over time.

19. Natural selection is one of the ways to \_\_\_\_\_ for the millions of species that have lived on Earth.

20. What two men are both credited with coming up with the theory of evolution by natural selection?

- a. \_\_\_\_\_
- b. \_\_\_\_\_

21. In natural selection, genetic \_\_\_\_\_ that are \_\_\_\_\_ to an individual's \_\_\_\_\_ are passed on through \_\_\_\_\_. This results in a new \_\_\_\_\_ of organisms that are \_\_\_\_\_ they to \_\_\_\_\_ to \_\_\_\_\_.

22. What is the outcome of an adaptation?

23. What is the phrase that is most closely associated with natural selection?

24. Is the phrase from #23 an accurate description of natural selection? \_\_\_\_\_

Due to geographic isolation lack of terrestrial predators, our birds have developed unique characteristics. Behavioral adaptations Behavioral adaptations are learned or inherited behaviors that help organisms survive. The mating cycle of the kÄÄÄÄÄ - päTM Ä' is closely linked to the fructification of tree rimu, and in the vintages of plentiful bearers, often more chicks kÄÄÄÄ often arise kÄÄÄ Investigate how New Zealand Ä' has come to have ecosystems so unique, one dominated by birds. After many years of not requiring use flight, they developed a larger body' and lost the capacity to fly. Read the adaptations of the takahÄ' in article The ecological niche of the takahÄs. The kerererÄÄ' has the widest' opening of any bird in the New Zealand forest. Mixed with fruit pulp, it supports the young in the early stages of life. These include things you can see, like its shape or body lining, as well as its internal organization. It's definitely not a fast process! Adaptations are made by natural selection. These are changes that happen over many, many generations. Surviving species breed, producing more ' individuals the population with the same characteristics that are conducive to survival. The kiwi plumage merges with the forest undergrowth to allow them to protect themselves from predators through camouflage. Native birds in a changing environment Many New Zealand birds are poorly adapted to an environment that Ä has changed considerably over time. Structural Adjustments Structural (or morphological) adjustments are changes to emoc emoc elarutan enoizeles al otatnemucod etnemairanigiuro niwraD selrahC .umir orehlablled imes ied etnemaretni isaqu onortun is «Äp«Äks«ÄÄK id inicuip I .af imna id inoilim 56 acric anawdnoG lad atarapes 'Ä is adnaleZ avouN aL .omsinagro'lled ehcsif of evolution in 1854 in his book on the Origin of Species. Adaptations are numerous and varied, but they are generally grouped into three main categories: structural, behavioural and physiological. Adaptations may involve the acquisition of a new or modified feature that translates into an advantage in the current environment, such as a specialized beak. This allows it to swallow, digest and disperse the large fruits and seeds of the karaka, miro and tawa trees. Their environment has changed enormously in the last 1000 years, mainly due to colonization by human colonizers. These adaptations allow the body to regulate its bodily functions, such as breathing and temperature, and to perform special functions such as excretion of chemicals as a defence mechanism. Kiwifruit have a thin mustache at the base of the beak to help them overcome obstacles in low light conditions, as they have poor vision. Takah and kiwi have vestigial wings. Adaptations can also result in the loss of a function that no longer has any function in the current environment, such as the loss of the function of the wing when it does not need to fly. These can occur in populations within one or a few generations. Organisms that have characteristics best suited to their habitat will survive for generations to come, while those that are least suited to the environment will not survive. Find out how our unique ecosystem has changed over the years in our evolving ecosystems. Over many generations, more and more individuals within the species will have the favorite characteristics until eventually all individuals will have them.
