If you own your car for a long time, you will likely be faced with the task of fixing or replacing the player in your car at some point. Many people assume that a CD player is a complicated electronic device, but that couldn't be further from the truth. The player is actually made up of just a few mechanical parts that can break, and repairing those parts is sometimes surprisingly simple. This could be related to the speakers and not the main unit of your audio system. Take the time to remove the covers from the speakers in your car and make sure there's no trapped dirt or damage. Also check the electrical connections on the back to make sure they are still firm and make a good connection. If the speakers look fine, another issue that could affect sound is the quality of the connections behind the head unit of your system. You'll need to open the dash to access the unit see your owner's manual or an auto repair manual for your car. Make sure all channel speaker connections are solid and make good contact. When you insert a disc, is the CD display blank. While it sounds simple, one of the most common mistakes people make is inserting a CD upside down. This will cause the player to act as though it isn't working. Is the music skipping or stopping completely. This is commonly caused by dirty or damaged tracks on the disc. Before assuming that the problem is with the player, test a few newer CDs and see if the skipping behavior continues.

If it doesn't, the the problem is the disc and you'll need to look into cleaning or repairing the disc so that it can play normally again. Performing the following maintenance on the CD player may repair the problem that you're seeing. Contamination of the lens with dust or dirt can significantly reduce the quality of the data read off of audio discs. You will need to remove the unit from the dash, open it up, and locate the lens. If you can open the CD door and see the lens by shining a flashlight inside, you can clean it by inserting a long Qtip moistened with pure isopropyl alcohol. Examine the lens after you've cleaned it. If you see any major scratches, that means that the lens assembly may require replacement, and you'd be better off buying an entirely new CD player. Most problems are caused by a dirty lens though, so a simple cleaning may do the trick. If you can get the end of a Qtip

under the lens and you can lift it up slightly, insert another alcoholmoistened swab underneath and clean off the turning mirror looks like glass under the lens. After cleaning, next check the movement of the lens itself. If it tends to stick while moving up or down, or it doesn't remain flat with the deck while being moved around this is a sign of a mechanical failure and that the entire unit may need to be replaced. Make sure to use jewelers screwdrivers and carefully store the screws that you remove they are tiny!. Examine the drawer mechanism for loose or broken parts. If there's a belt, check that it is still attached and tight. Replacing the belt is an easy and cheap fix. Examine all gears and observe the electric motors for any burn marks or damage. Apply silicone grease to moving parts. If the door is noisy, you can also put a drop of electric motor oil inside the electric motors to quiet them. Many CD players have a lock attached to the door that is used to protect the device during shipping.

Check that the lock is not in place or otherwise blocking the sled drive from extracting the CD. If the inner workings are somewhat dirty, this could be the cause of the problems. Using either an air compressor with an air gun attachment or a toothpick, try to remove dirt and grime from the gears and other moving parts. Lubricate the moving parts with silicone grease to aid operation. However, there will be times when there are mechanical failures. Don't be afraid to tackle the repair work yourself. Often, just replacing a very inexpensive part or cleaning the inner workings of the drive will completely renew the device back to perfect working condition. Learn why people trust wikiHow To create this article, 34 people, some anonymous, worked to edit and improve it over time. Thus, stuck CDs in cars can be a particularly annoying problem. Luckily, a variety of DIY fixes exist for this common

headache. Note, however, that, if done improperly, some of these fixes can damage your player or the CD stuck in it. The advice in this article shouldn't be a substitute for the opinion of an automotive expert. See Step 1 below to get started.

Press your CD player's power and eject buttons down at the same time, holding them for about ten seconds. Some CD players may not function when the car is turned off. For these players, try pressing and holding the power and eject buttons while the car is running. If you still have it, consult your CD player's owner's manual, which should include information on this and other functions that can help you retrieve your CD. This method involves inserting a second CD into the player, so, to prevent damage to a beloved album, try to procure a blank CD or one that you otherwise don't care about. If this requires you to start the car, then start the car and turn the CD player on. Use caution when inserting any foreign objects into your CD player. If you're ever worried about damaging your CD player, stop and take your problem to a professional. Your CD should be above the stuck CD. With luck, you'll be able to feel the stuck CD slide beneath the one in your hand. CD players can differ in their precise ejection mechanism, so sometimes upward pressure can be more successful in giving the ejection mechanism traction on a stuck CD than downward pressure. Sometimes, applying pressure to the unit itself can help the stuck CD gain traction. If the player is mounted in such a way that it's near the upper surface of the dashboard, you may have success repeating the steps in this method while pressing or gently but firmly smacking the area of the dashboard above the player. This method is useful when you can't remove a CD because your CD player will no longer turn on. This method involves disconnecting, then reconnecting the electrical supply to the CD player. For most CD players, this means that any radio presets you've set will be erased and your personal audio settings will be reset to their defaults. If you're an avid listener of music in your car, make sure you record your personal settings so they can easily be restored afterward.

When manipulating or altering your car's electrical system, it's important to ensure you're not in danger of electrocution. Turn the car off and remove the keys from the ignition, then open the hood for access to the battery. The negative terminal on a car's battery is colored black, while the positive terminal is colored red. Carefully disconnect the negative terminal. After reconnecting the terminal, turn the car on and try to eject the CD as normal. Check your owner's manual often, a car's fuse box will be behind a panel somewhere on the driver's side of the dashboard. Disconnect the battery, remove the fuse box's protective covering, then, consulting your owner's manual, replace any of your CD player's fuses that may have blown. In this method, you insert a long, flat knife or similar object directly into the CD player. Knives made from metal conduct electricity, so, if you have an object made from wood or plastic that will work like, for instance, a popsicle stick, use it. If not, be sure to disconnect all power supplies from the CD player and make sure any electrical charge has been removed. If you don't want to put your property at risk, take your car to a trained automotive professional. Use a strong tape like Gorilla tape for best results. Putty knives are typically tapered so that if you wrap the tape tight enough, it will not slide off the end. If you're using another object, like a popsicle stick, which doesn't taper, you may need to stick the tape to the object, wrap it around several times, then put a twist in the tape and wrap it around several more times to make sure the tape is adequately secured to the object. Because your knife or stick, etc. is now covered with sticky tape, it can be difficult to insert it into the CD player. To make this process easier, use paper to make one side of your knife smooth. Stick a small piece of printer or construction paper onto your knife. Trim the paper with scissors so that it matches the size and shape of the knife.

Delicately wiggle your knife to feel for the top of the CD. Press down gently to get the tape to stick to the CD. When you feel that your knife is stuck to the CD, gently try to lift and remove the CD. As above, disconnect all power supplies from the CD player and make sure any electrical charge has been removed. Turn the car and CD player off and disconnect the battery's negative terminal. For this method, you want a card that's thin but sturdy. Use an expired credit card or a similar object

preferably, one that's not important, in case you lose it or it breaks. Stick double-sided scotch tape on one side of the card, near the edge of one of the two narrow ends. This method, though similar to the putty knife method above, differs in that it uses a screwdriver to assist with sticking the card to the CD. You'll want a fairly short, thin flat head screwdriver. Use a screwdriver that's as thin as possible, as you'll need to partially insert it into the CD slot. You may need to use the screwdriver to guide the card, ensuring it goes in above the CD and does not stick to the CD until after you get 1.2 to 3.4 inch (1.3 to 1.9 cm) of the card in. Use the screwdriver to gently press down on the card. This should cause the tape on the bottom side of the card to stick to the top side of the stuck CD. With luck, the CD should come with the card. If not, try repeating the previous steps. But, if using the card method, use two cards, one on top and one on the bottom. If that doesn't work, don't force it. The only other option is to open your CD player by unscrewing the face. Use a generous amount and leave on the scratch for 5 minutes. Buff off with a clean, soft cloth. Wipe from side to side, never in a circular motion. How can I get it out? It just says CD error. How do I fix this? Put the tape on the knife and slide it in under the CD that is stuck. Gently push up and pull out. To create this article, 34 people, some anonymous, worked to edit and improve it over time.

This article has been viewed 1,663,252 times. If that doesn't work, turn the car and CD player back on, then insert a blank CD about 1 inch into the CD slot. Press the eject button and gently wiggle the blank CD around in the slot until the stuck CD pops out. If you're still not having any luck, you may need to perform an electrical reset to dislodge the CD. To learn about removing a stuck CD with a plastic card and screwdriver, read on!
